

R10: worst type/value/delay stratum

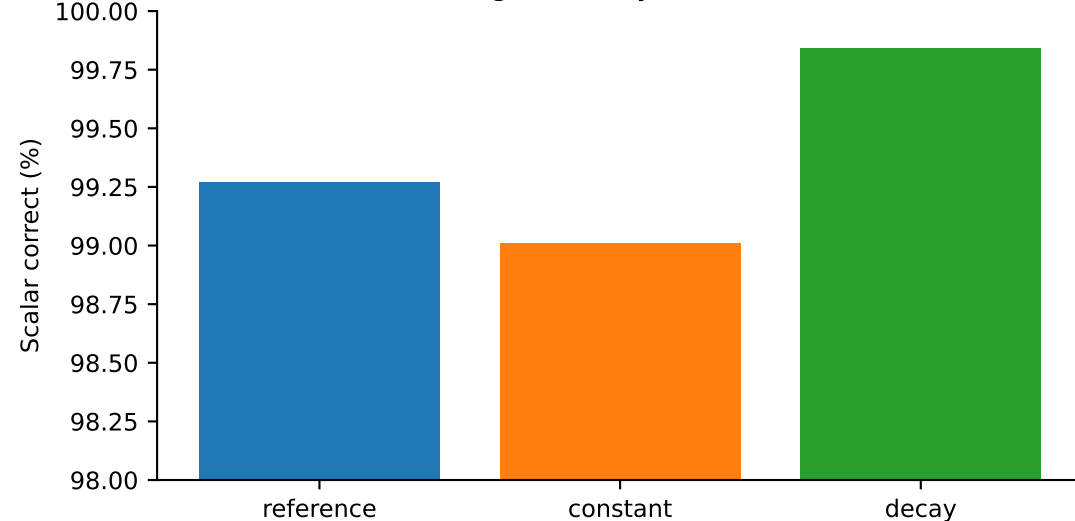

R11: worst type/value/delay stratum

Original-mixture reused-validation minimum

R11 training fit · delay 16 / 2 distractors

R10/R11 fixed development screens fail: calibration threshold governs; reused validation cannot override failure. One development backbone; no promotion.
 R11 decay versus constant identifies a relative learning-rate effect; reference is the inherited endpoint, not a same-initialization additional-exposure control.
